

ads and disads of solar cells

ads:

no polluting gases, quiet, low maintenance, can be placed on roofs, clean, cheap to run

disads:

intermittent supply, unattractive, takes up space, uses land, d.c. supply

how the sun is responsible for energy in fossil fuels

sun is the source for plants/living matter to grow

plant/animal remains compressed into fuel OR carbon/chemical energy stored in plant/animal remains

how forces and acceleration of falling body change

mention of air resistance and weight of object

acceleration at start of fall is acceleration due to gravity = 10ms^{-2}

acceleration decreases as it falls

air resistance increases as speed increases

acceleration zero/terminal velocity reaches when

upward air resistance force = downward weight

pressure in terms of momentum

molecules/atoms collide with wall

molecules/atoms rebound

force on wall = total rate of change of momentum

force over area = pressure

why larger piston will move less in hydraulics

volume of oil moved at both same;

area of small x distance moved by small = area of big x distance moved by big (thus distance moved by big less);

manometer cross section and h

h will not change with a change in cross-sectional area;

as pressure only dependent on h, g, P;

density from water method

water used in measuring cylinder;

volume of water known or read;

place ____ in the water and read the new level of water in cylinder;

subtract to find volume of ____;
