

Drugs

Drug: Any substance taken into the body that modifies or affects chemical reactions in the body.

Antibiotics: Chemicals that are used to treat bacterial infections

Resistant bacteria: A bacteria that is resistant to an antibiotic

* The antibiotics damage the cell wall of the bacteria. That is why they are ineffective on viruses, as viruses do not have cell walls.

MRSA: * A resistant bacteria

* Causes hospital acquired infections

* If not treated, might be fatal

* Treatment is a combination of antibiotics.

→ Harmful when there is a break in the skin, and the bacteria gets into the blood

→ Infects internal organs, or causes blood poisoning.

How to reduce the development of resistant bacteria:

1- Do not take antibiotics very often for minor complaints

2- Do not take antibiotics for viral infections

3- Complete the treatment course to kill all bacteria

4- Take combinations of antibiotic

5- Rotation of antibiotics used
