

All Required Diagrams For Biology BY Vasumitra

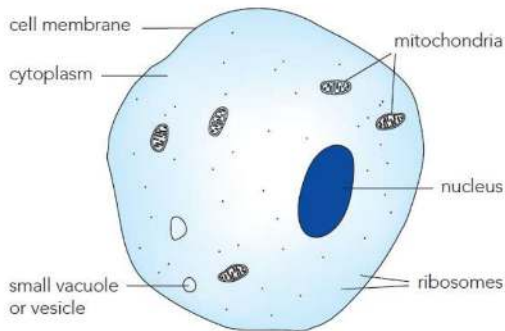

Figure 2.2: An animal cell as it appears through a light microscope.

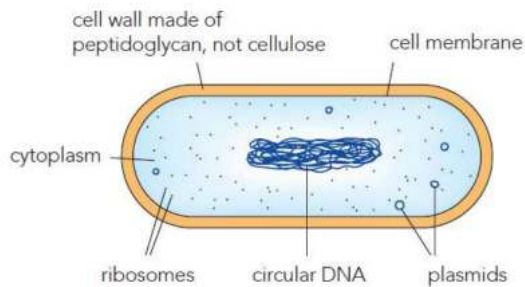

Figure 2.14: A bacterial cell.

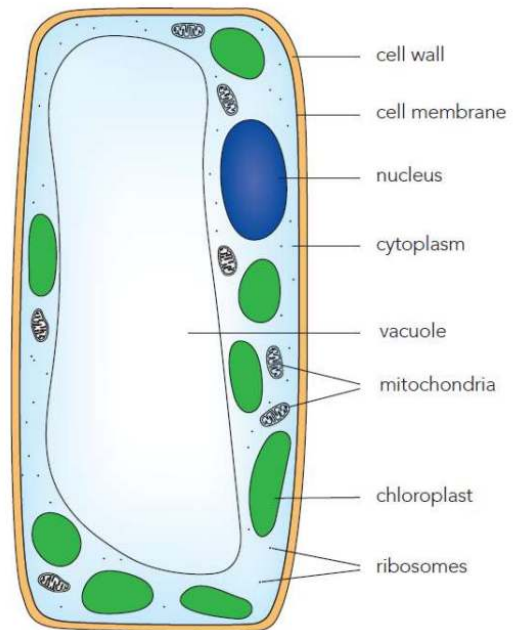

Figure 2.3: A plant cell as it appears through a light microscope.

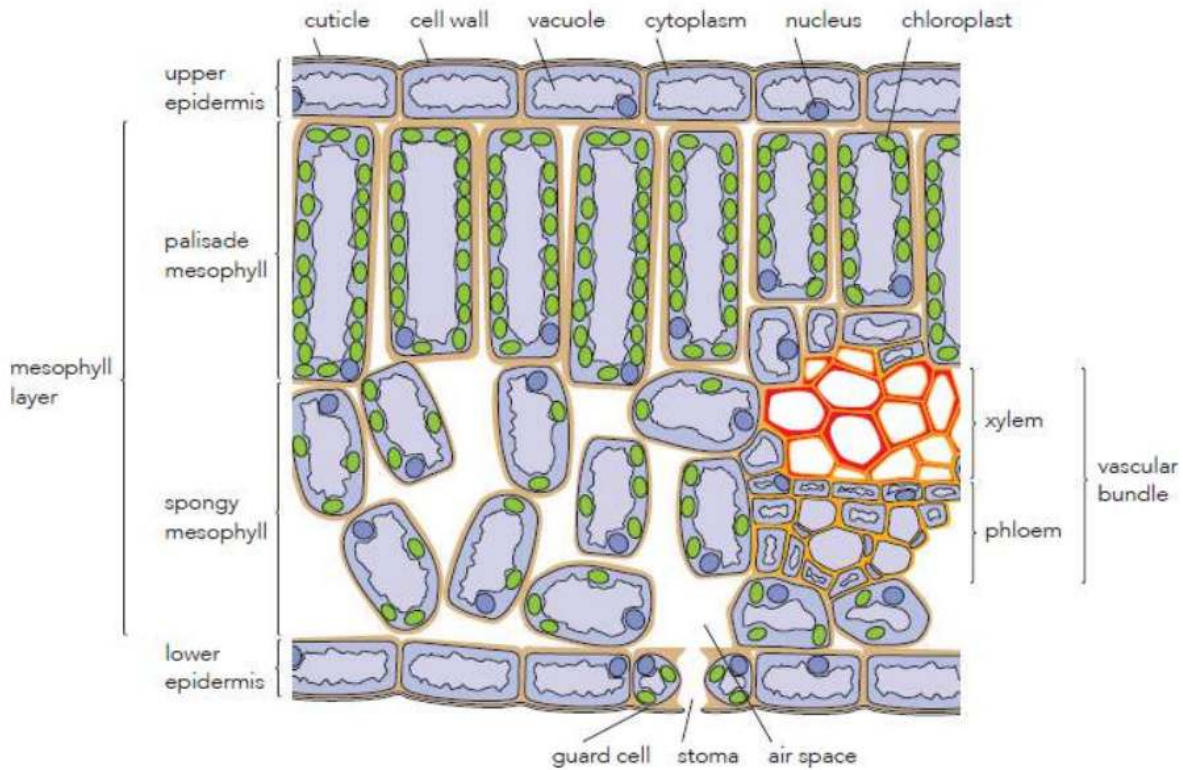

Figure 6.11: A diagram of a transverse section (TS) through a leaf.

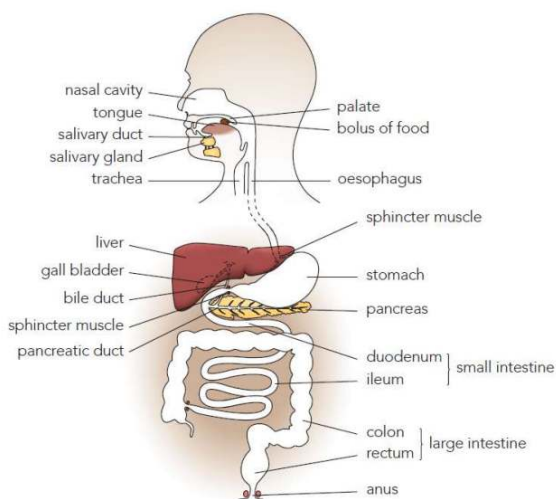

Figure 7.8: The human digestive system.

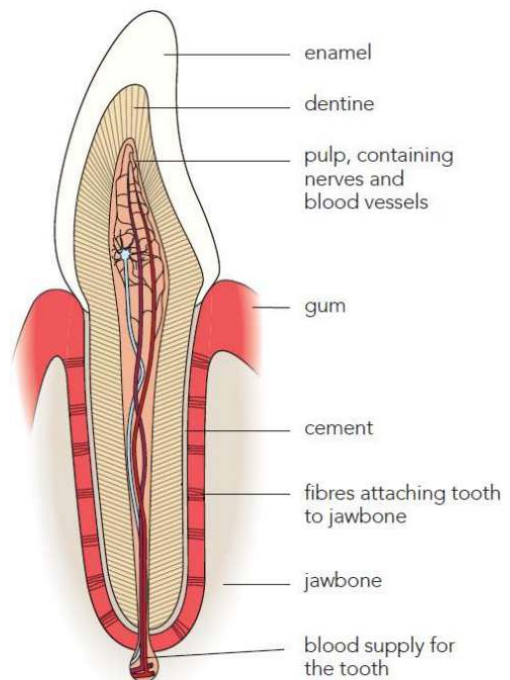

Figure 7.10: The structure of an incisor tooth.

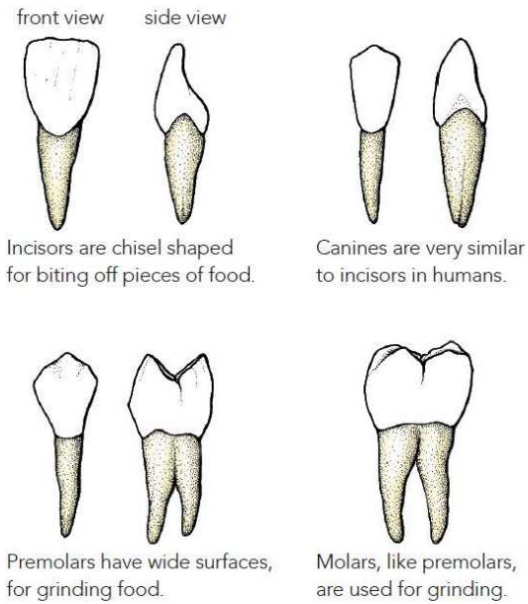

Figure 7.11: The four types of mammalian teeth.

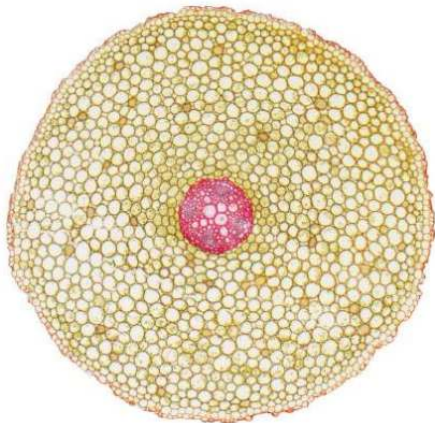

Figure 8.5: Photomicrograph of a section across a plant root.

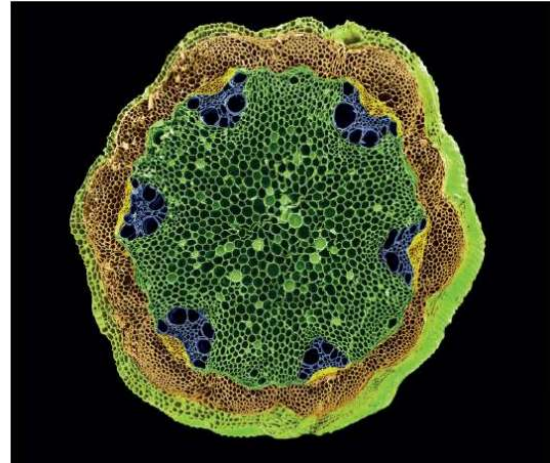

Figure 8.4: Scanning electron micrograph of a section across a plant stem.

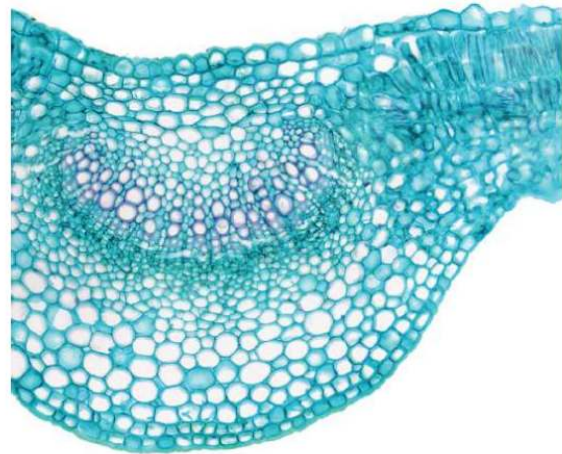

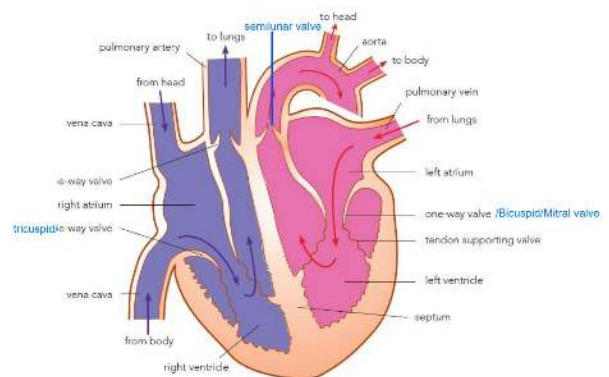

Figure 8.6: Photomicrograph of a section across a plant leaf.

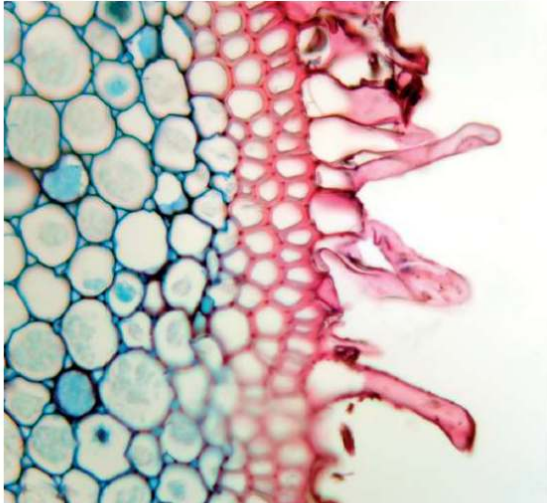

Figure 8.10: A photomicrograph showing part of a transverse section of a root ($\times 100$). You can see several root hairs on the right-hand side.

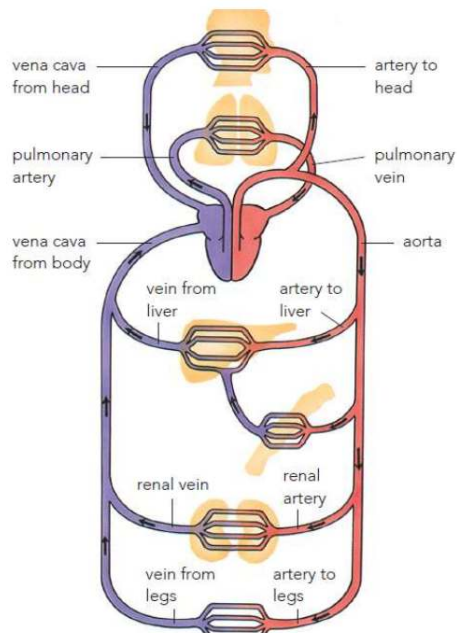

Figure 9.16: Plan of the main blood vessels in the human body. Red represents oxygenated blood, and purple represents deoxygenated blood.

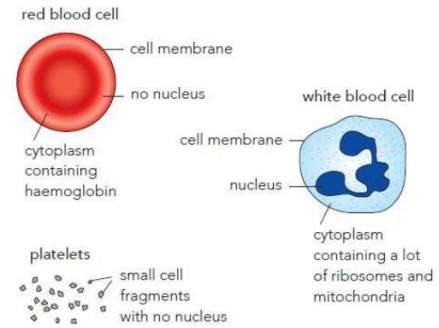

Figure 9.18: The components of blood. These cells and cell fragments float in a pale yellow liquid called plasma.

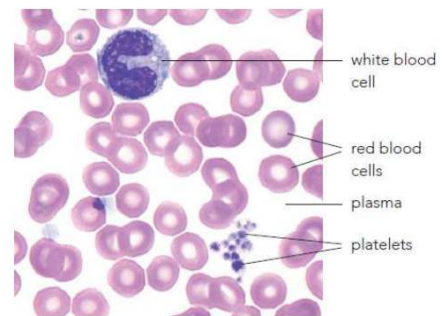

Figure 9.19: A photomicrograph of blood. The blood has been coloured with a stain to make the different kinds of cell show up clearly ($\times 1500$).

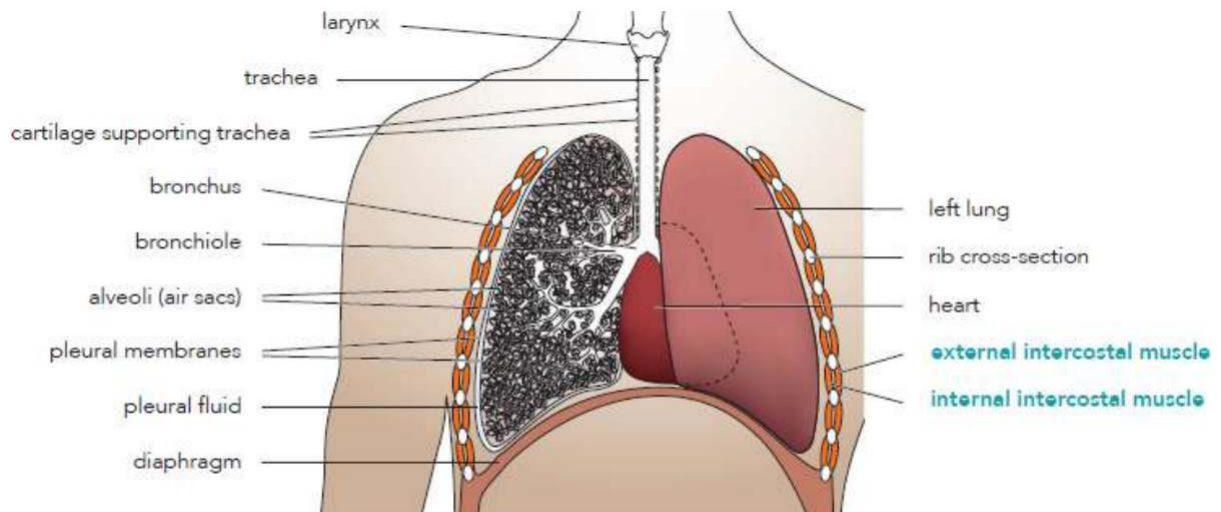

Figure 11.3: The human gas exchange system.

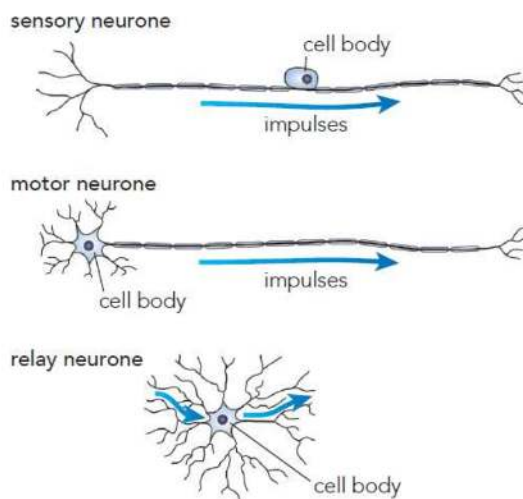

Figure 12.6: The structure of sensory, motor and relay neurones.

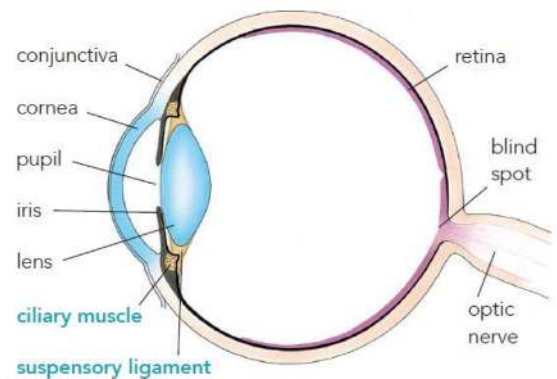

Figure 12.10: A section through the eye. Note: you only need to learn about the ciliary muscle and the suspensory ligament if you are studying the Supplement.

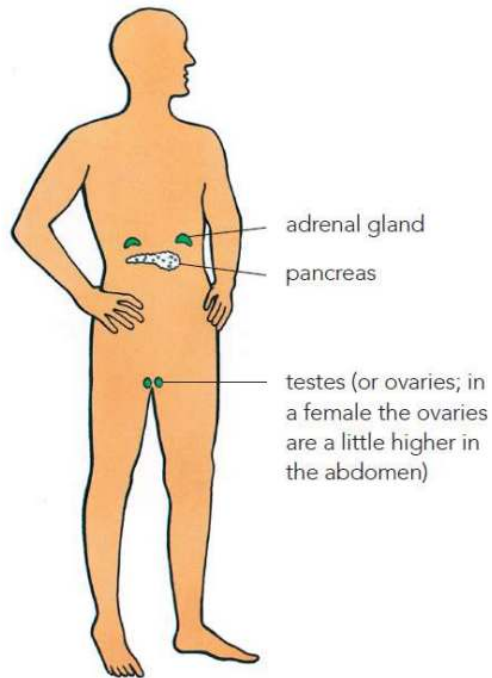

Figure 12.19: The positions of some endocrine glands in the body.

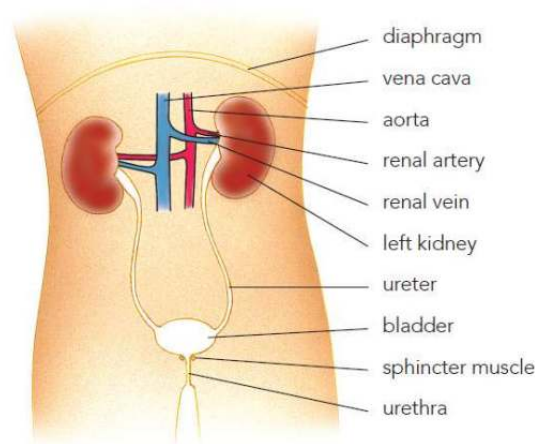

Figure 13.2: The human excretory system.

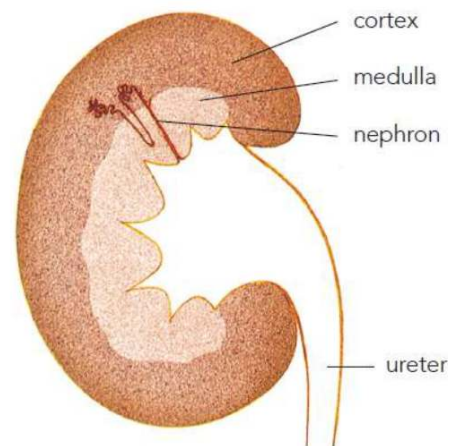

Figure 13.4: A longitudinal section through a kidney.

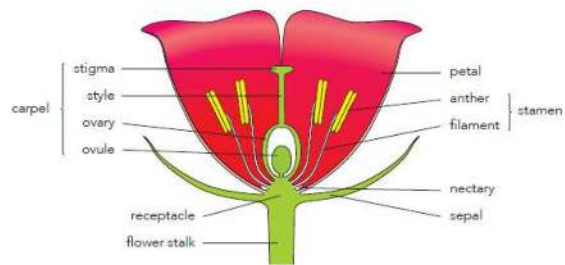

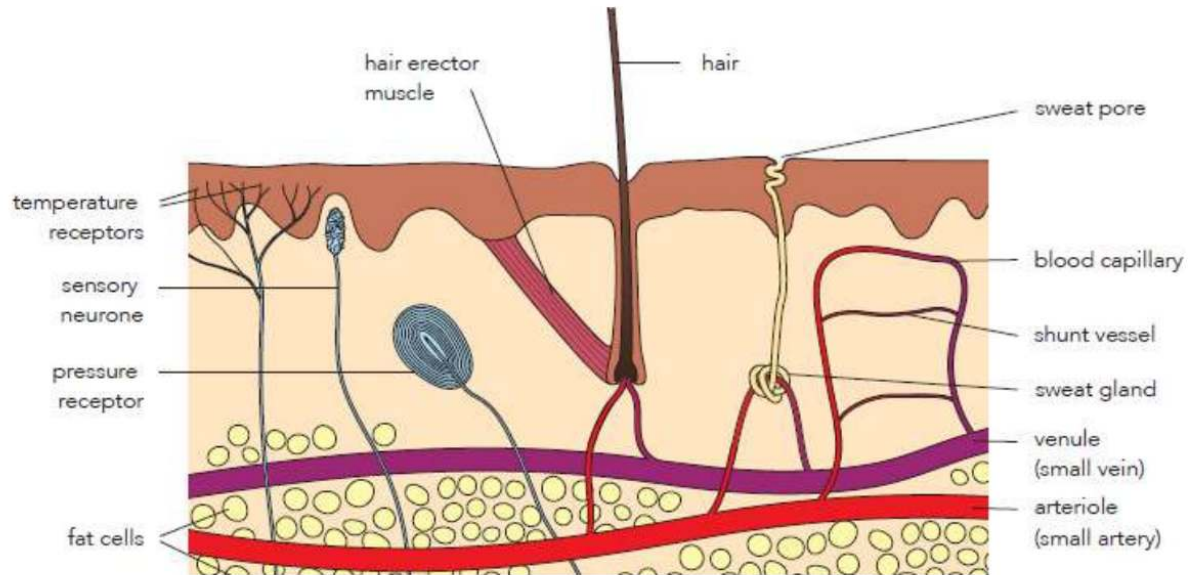

Figure 14.6: The structure of a simple flower.

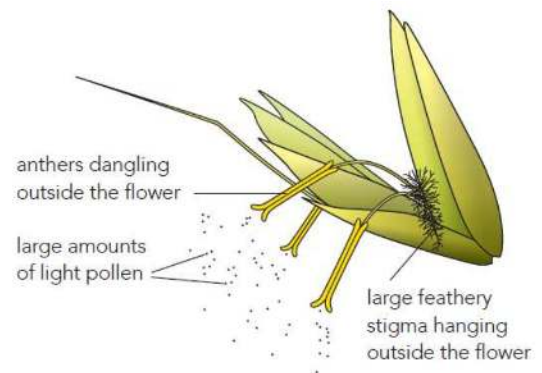

Figure 14.12: A grass flower – an example of a wind-pollinated flower.

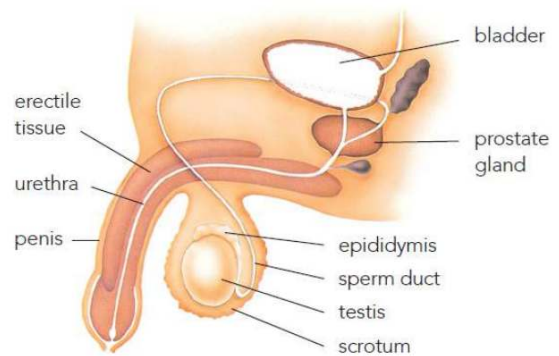

Figure 15.4: Side view of the male reproductive organs.

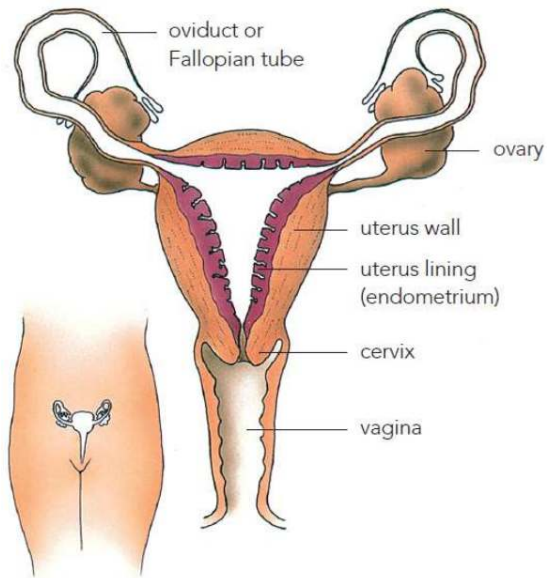

Figure 15.3: The female reproductive organs.

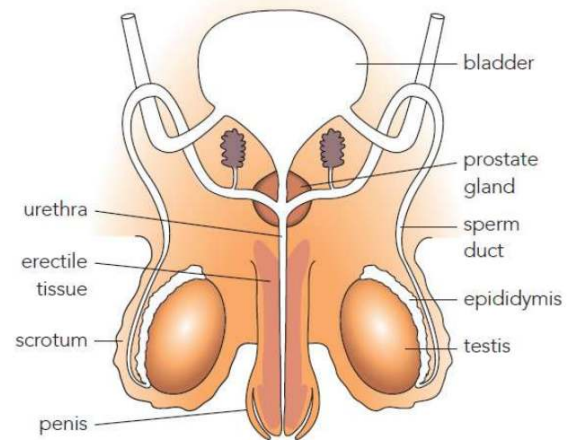

Figure 15.5: Front view of the male reproductive organs.

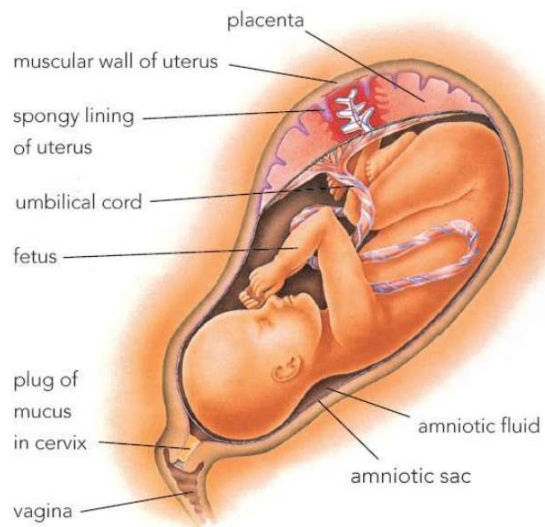

Figure 15.15: A fetus in the uterus, just before birth.
